

XML DOM - The CDATASection Object

Try it Yourself - Examples

The examples below use the XML file [books.xml](#).

[createCDATASection\(\) - Create a CDATA section node](#)

The CDATASection object

The CDATASection object represents a CDATA section in a document.

A CDATA section contains text that will NOT be parsed by a parser. Tags inside a CDATA section will NOT be treated as markup and entities will not be expanded. The primary purpose is for including material such as XML fragments, without needing to escape all the delimiters.

The only delimiter that is recognized in a CDATA section is "]]>" - which indicates the end of the CDATA section. CDATA sections cannot be nested.
